CS 305 Computer Networks

Chapter 3 Transport Layer (2)

Jin Zhang

Department of Computer Science and Engineering

Southern University of Science and Technology

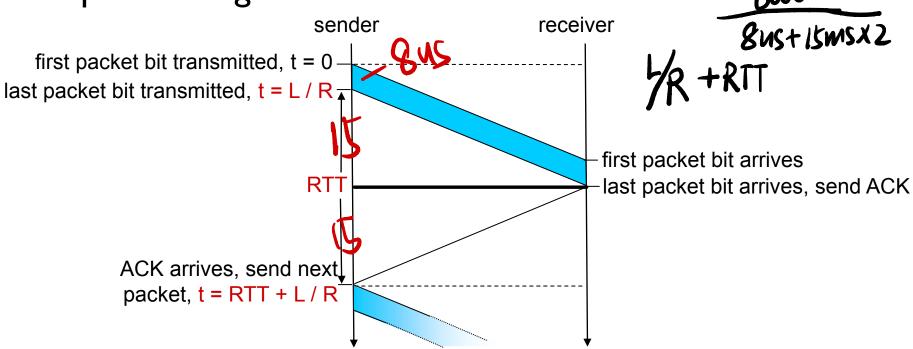

Chapter 3 outline

- 3.1 transport-layer services
- 3.2 multiplexing and demultiplexing
- 3.3 connectionless transport: UDP
- 3.4 principles of reliable data transfer

- 3.5 connection-oriented transport: TCP
 - segment structure
 - reliable data transfer
 - flow control
 - connection management
- 3.6 principles of congestion control
- 3.7 TCP congestion control

Performance of rdt3.0

- rdt3.0 is correct, but performance is bad
- e.g.: link rate R=I Gbps, prop. delay T_{pd}=I5 ms, packet length L=8000 bit

Calculate U sender: utilization – fraction of time sender busy sending

Performance of rdt3.0

❖ link rate R=I Gbps, prop. delay T_{pd}=I5 ms, packet length L=8000 bit

$$D_{trans} = t = \frac{L}{R} = \frac{8000 \text{ bits}}{10^9 \text{ bits/sec}} = 8 \text{ microsecs}$$

U sender: utilization – fraction of time sender busy sending

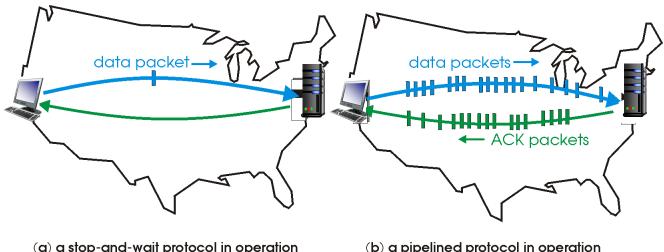

$$U_{\text{sender}} = \frac{L/R}{RTT + L/R} = \frac{.008}{30.008} = \boxed{0.00027}$$

- RTT=30 msec, IKB pkt every 30 msec:
 33kB/sec throughput over I Gbps link
- network protocol limits use of physical resources!

Pipelined protocols

pipelining: sender allows multiple, "in-flight", yetto-be-acknowledged pkts

- range of sequence numbers must be increased
- buffering at sender and/or receiver

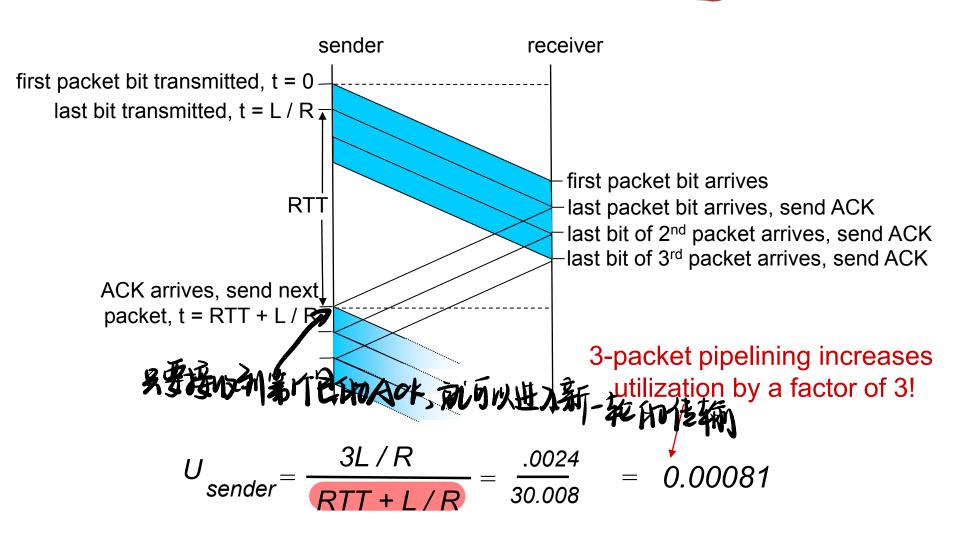

(a) a stop-and-wait protocol in operation

(b) a pipelined protocol in operation

two generic forms of pipelined protocols: go-Back-N, selective repeat

Pipelining: increased utilization

Go-Back-N overview

总是保证在八日在传输 sendér sender window (N=4) 012345678 send pkt0 012345678 send pkt1 send pkt2 012345678 Xloss send pkt3 012345678 (wait) 0 1 2 3 4 5 6 7 8 rcv ack0, send pkt4 012345678 rcv ack1, send pkt5 ignore duplicate ACK pkt 2 timeout_ pkt2 send 012345678 pkt3 send 012345678 pkt4 send 012345678 send pkt5 012345678

Retransmit all pkts upon

pkt loss or error (GBN)

No buffer, Cumulative ACK

receive pkt0, send ack0 receive pkt1, send ack1

receiver

receive pkt3, discard, (re)send ack1

(re)send ack1

(re)send ack1

receive pkt5, discard,

表示之前的都成功3 累计的收到aokl

rcv pkt2, deliver, send ack2 rcv pkt3, deliver, send ack3 rcv pkt4, deliver, send ack4 rcv pkt5, deliver, send ack5

Go-Back-N: sender

- k-bit seq # in pkt header (not 0 or 1)
- At most N pkts in flight: window size = N, (N consecutive unacked pkts allowed

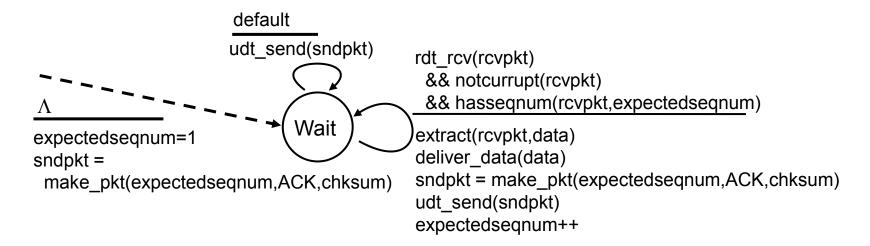

- ACK(n) means all pkts before pkt n are correctly received "cumulative ACK"
 - Sender may receive duplicate ACKs (see receiver)
- timer for oldest in-flight pkt
- timeout(n): retransmit packet n and all higher seq # pkts in window

GBN: sender extended FSM

```
rdt send(data)
                       if (nextsegnum < base+N) {
                         sndpkt[nextseqnum] = make pkt(nextseqnum,data,chksum)
                         udt send(sndpkt[nextsegnum])
                         if (base == nextseqnum)
                           start timer
                         nextseqnum++
                       else
                        refuse data(data)
  base=1
  nextsegnum=1
                                          timeout
                                          start timer
                            Wait
                                          udt_send(sndpkt[base])
                                          udt send(sndpkt[base+1])
rdt rcv(rcvpkt)
 && corrupt(rcvpkt)
                                          udt send(sndpkt[nextsegnum-1])
                         rdt rcv(rcvpkt) &&
                           notcorrupt(rcvpkt)
                         base = getacknum(rcvpkt)+1
                         If (base == nextseqnum)
                           stop_timer 不需要timer 3
                          else
                           start_timer Fift Start
```

GBN: receiver extended FSM

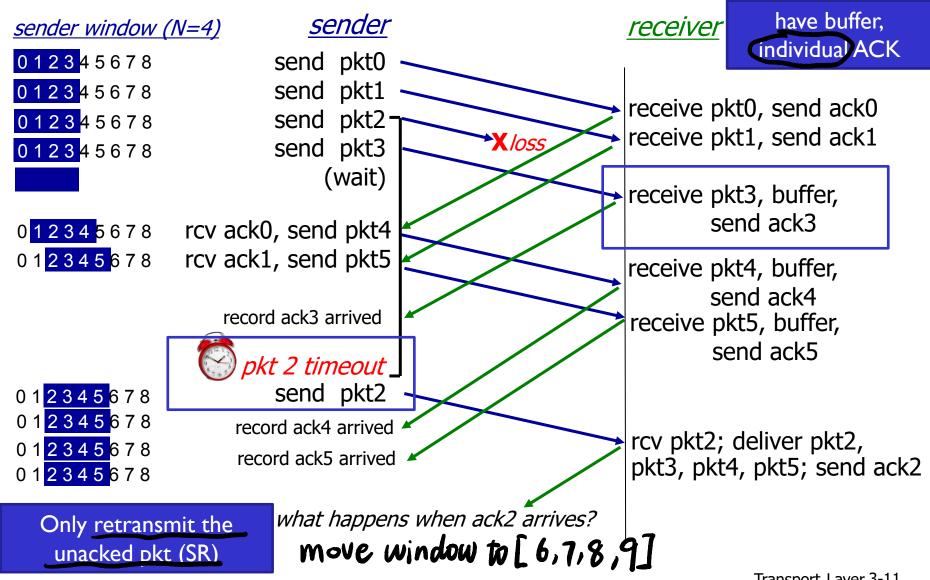

ACK-only: always send ACK for correctly-received pkt with highest *in-order* seq

- may generate duplicate ACKs
- need only remember expectedseqnum
- out-of-order pkt:
 - discard (don't buffer): no receiver buffering!
 - re-ACK pkt with highest in-order seq #

Selective repeat

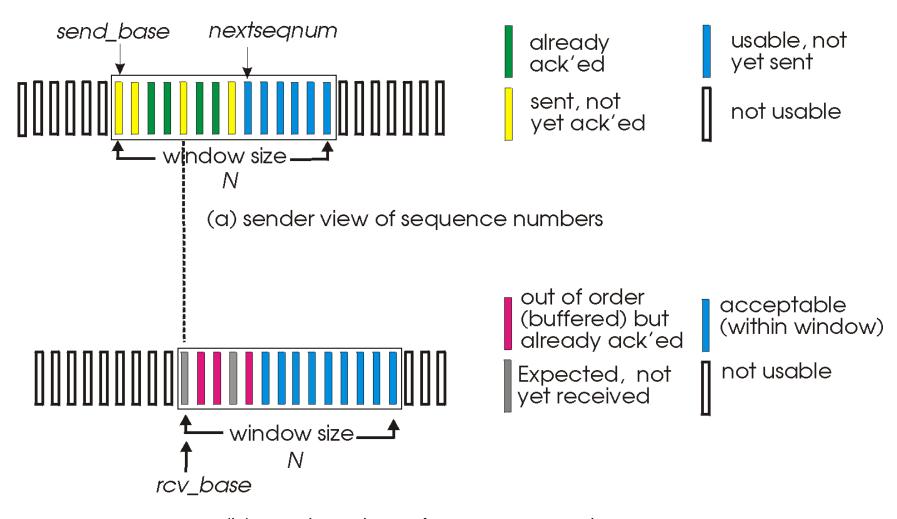

Sequence num bit 事场知是数

Selective repeat

- receiver individually acknowledges all correctly received pkts
 - buffers pkts, as needed, for eventual in-order delivery to upper layer
- sender only resends pkts for which ACK not received
 - sender timer for each unACKed pkt
- sender window
 - N consecutive seq #'s
 - limits seq #s of sent, unACKed pkts

Selective repeat: sender, receiver windows

(b) receiver view of sequence numbers

Selective repeat

sender

data from above:

if next available seq # in window, send pkt

timeout(n):

resend pkt n, restart timer

ACK(n) in [sendbase,sendbase+N]:

- mark pkt n as received
- if n smallest unACKed pkt, advance window base to next unACKed seq #

receiver

pkt n in [rcvbase, rcvbase+N-1]

- sepd ACK(n)
- Out-of-order: buffer
- in-order: deliver (also deliver buffered, in-order pkts), advance window to next not-yet-received pkt

pkt n in [rcvbase-N,rcvbase-I]

* ACK(n) discard

otherwise:

ignore

GBN and SR comparison

N: RTT, Recieve buffer size, 网络(router) Size, 因太重活 Go-back-N: Selective Repeat: 将派大.

- sender can have up to N unacked packets in pipeline
- receiver only sends cumulative ack
 - doesn't ack packet if there's a gap
- sender has timer for oldest unacked packet
 - when timer expires, retransmit all unacked packets

- sender can have up to N unack' ed packets in pipeline
- rcvr sends individual ack for each packet

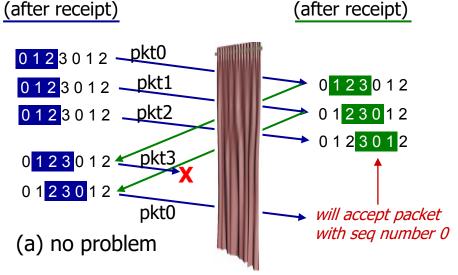

- sender maintains timer for each unacked packet
 - when timer expires, retransmit only that unacked packet

Selective repeat: dilemma

example:

- * seq #' s: 0, 1, 2, 3
- window size=3
- receiver sees no difference in two scenarios!
- duplicate data accepted as new in (b)

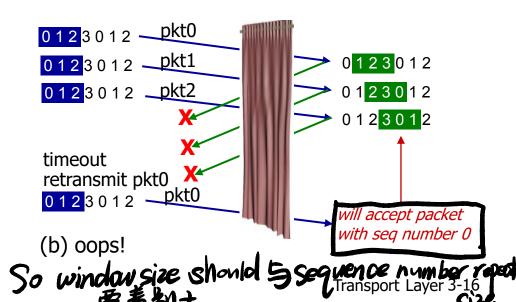

Q: what relationship between seq # size and window size to avoid problem in (b)?

receiver window

sender window

receiver can't see sender side.
receiver behavior identical in both cases!
something's (very) wrong!

Chapter 3 outline

- 3.1 transport-layer services
- 3.2 multiplexing and demultiplexing
- 3.3 connectionless transport: UDP
- 3.4 principles of reliable data transfer

- 3.5 connection-oriented transport: TCP
 - segment structure
 - reliable data transfer
 - flow control
 - connection management
- 3.6 principles of congestion control
- 3.7 TCP congestion control

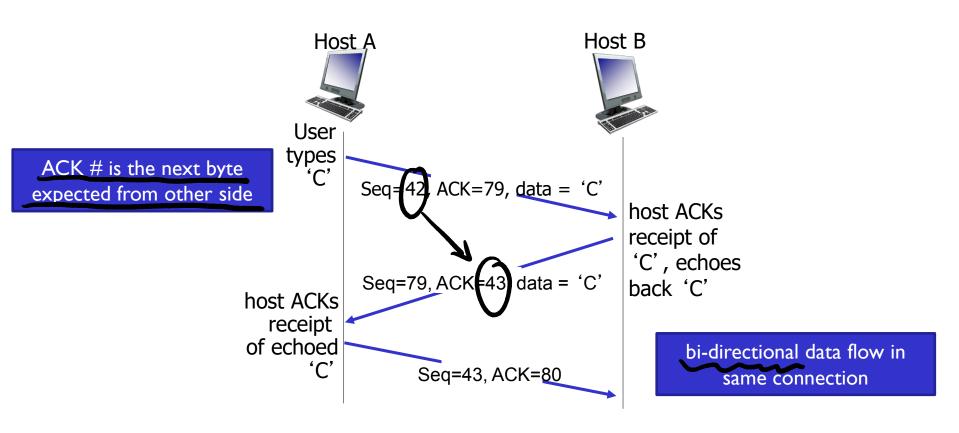

TCP: Overview RFCs: 793,1122,1323, 2018, 2581

- point-to-point:
 - one sender, one receiver
- reliable, in-order byte stream:
 - no "message boundaries"
 - Seq # and Ack # are in unit of byte, or pkt/2
- * pipelined:
 - TCP congestion and flow control set window size

full duplex data:

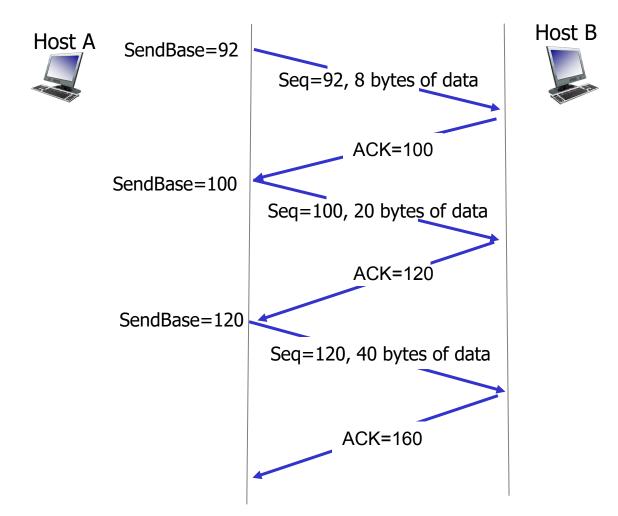

- bi-directional data flow in same connection
- MSS: maximum <u>segment</u>
 size
- connection-oriented:
 - handshaking (exchange of control msgs) inits sender, receiver state before data exchange
- flow controlled:
 - sender will not overwhelm receiver

TCP seq. numbers, ACKs

simple telnet scenario

TCP without retransmission

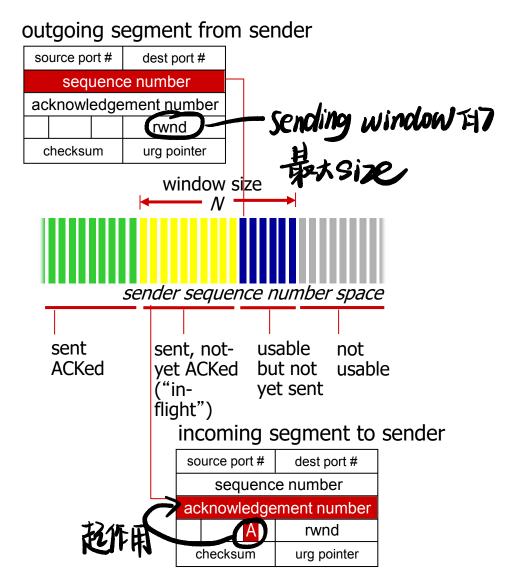

TCP seq. numbers, ACKs

sequence numbers:

• byte stream "number" of first byte in segment's data

acknowledgements:

- seq # of next byte expected from other side
- cumulative ACK
- Q: how receiver handles out-of-order segments
 - A: TCP spec doesn't say,
 - up to implementor

TCP segment structure

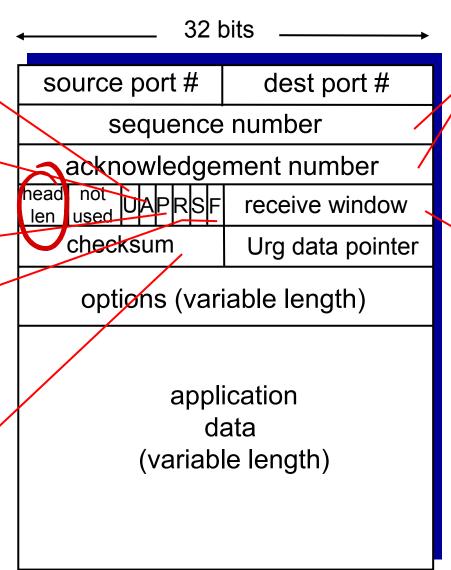

URG: urgent data (generally not used)

ACK: ACK # valid

PSH: push data now (generally not used)

RST, SYN, FIN: connection estab (setup, teardown commands)

> Internet checksum' (as in UDP)

counting by bytes of data (not segments!)

bytes
rcvr willing
to accept

TCP round trip time, timeout

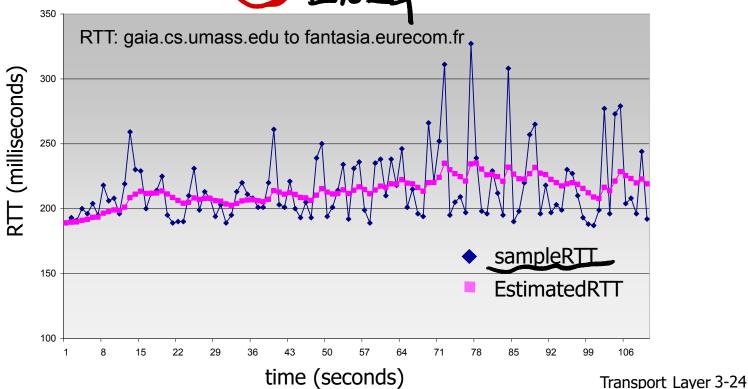

- Q: how to set TCP timeout value? RTT+ margin
- * longer than RTT variance transmission until ACK
 - but RTT varies
- too short: premature timeout, unnecessary retransmissions
- too long: slow reaction to segment loss

- Q: how to estimate RTT? SampleRTT: measured time from segment
 - receipt
 - ignore retransmissions
- SampleRTT will vary, want estimated RTT "smoother"
 - average several recent measurements, not just current SampleRTT

TCP round trip time, timeout

EstimatedRTT = $(1-\alpha)$ *EstimatedRTT + α *SampleRTT

- exponential weighted moving average
- influence of past sample decreases exponentially fast
- * typical value: $\alpha = 0.12$

TCP round trip time, timeout

- * timeout interval: EstimatedRTT plus "safety margin"
 - large variation in EstimatedRTT -> larger safety margin
- estimate SampleRTT deviation from EstimatedRTT:

```
DevRTT = (1-\beta) *DevRTT +
                \beta* | SampleRTT-EstimatedRTT |
                (typically, \beta = 0.25)
```

TimeoutInterval = EstimatedRTT + 4*DevRTT

estimated RTT "safety margin"

Chapter 3 outline

- 3.1 transport-layer services
- 3.2 multiplexing and demultiplexing
- 3.3 connectionless transport: UDP
- 3.4 principles of reliable data transfer

- 3.5 connection-oriented transport: TCP
 - segment structure
 - reliable data transfer
 - flow control
 - connection management
- 3.6 principles of congestion control
- 3.7 TCP congestion control

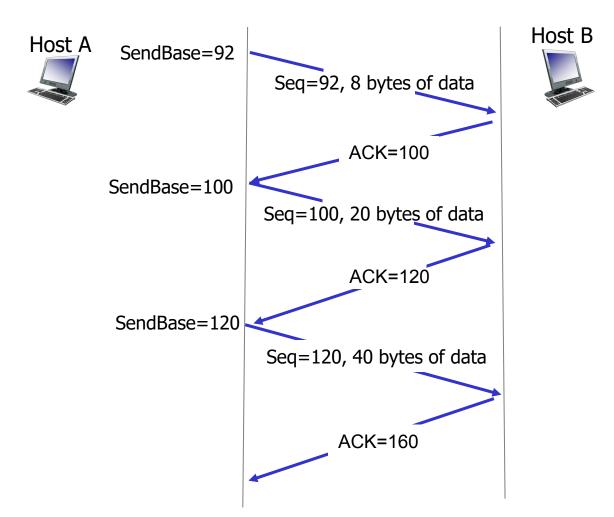

TCP reliable data transfer

- TCP creates rdt service on top of IP's unreliable service
 - pipelined segments
 - cumulative acks
 - single retransmission timer
 - Similar with Go-Back-N
- retransmissions triggered by:
 - timeout events
 - duplicate acks

let's initially consider simplified TCP sender:

- ignore duplicate acks
- ignore flow control, congestion control

TCP without retransmission

TCP sender events:

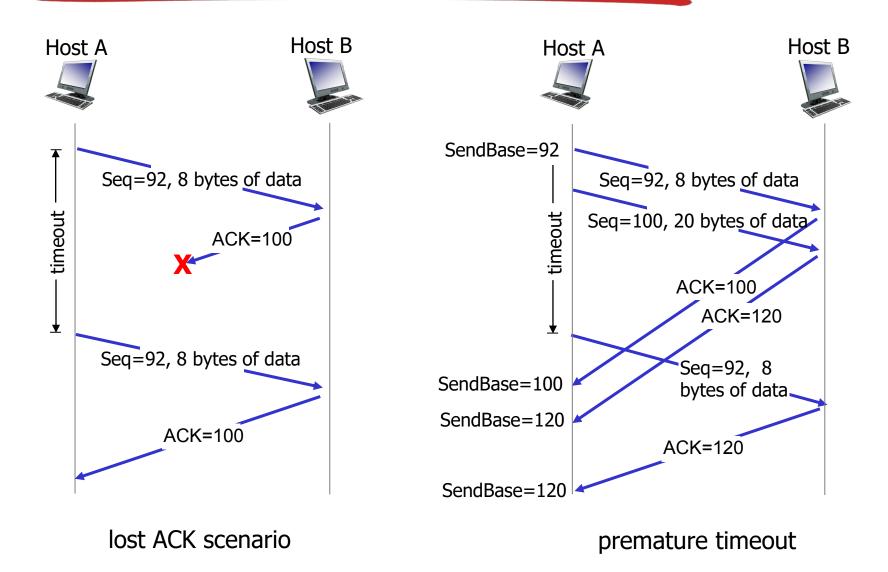

data rcvd from app:

- create segment with seq #
- seq # is byte-stream number of first data byte in segment
- start timer if not already running
 - think of timer as for oldest unacked segment
 - expiration interval:
 TimeOutInterval

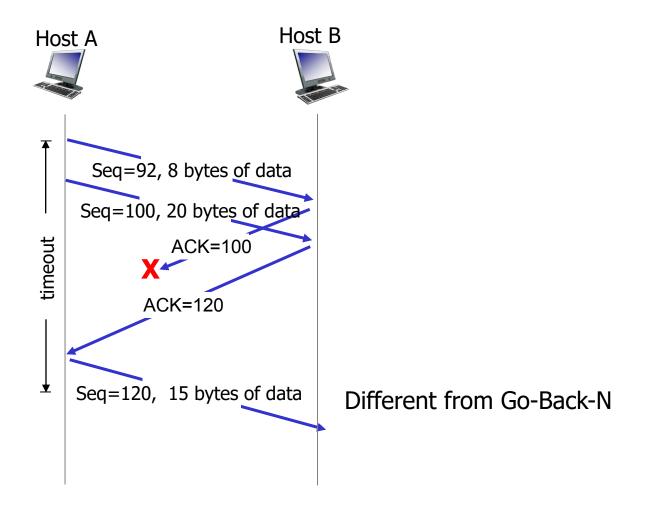

timeout:

- retransmit segment that caused timeout
- restart timer ack rcvd:
- if ack acknowledges previously unacked segments
 - update what is known to be ACKed
 - start timer if there are still unacked segments

TCP: retransmission scenarios

TCP: retransmission scenarios

cumulative ACK

TCP receiver [RFC 1122, RFC 2581]

event at receiver	TCP receiver action
arrival of in-order segment with expected seq #. All data up to expected seq # already ACKed	delayed ACK. Wait up to 500ms for next segment. If no next segment, send ACK
arrival of in-order segment with expected seq #. One other segment has ACK pending	immediately send single cumulative ACK, ACKing both in-order segments
arrival of out-of-order segment higher-than-expect seq. # . Gap detected loss happened	immediately <u>send <i>duplicate ACK</i>.</u> indicating seq. # of next expected byte
arrival of segment that partially or completely fills gap	immediate send ACK, provided that segment starts at lower end of gap

TCP fast retransmit

- time-out period often relatively long:
 - long delay before resending lost packet
- detect lost segments via duplicate ACKs.
 - sender often sends many segments backto-back
 - if segment is lost, there will likely be many duplicate ACKs.

TCP fast retransmit

if sender receives 3
ACKs for same data
("triple duplicate ACKs"),
resend unacked
segment with smallest
seq #

 likely that unacked segment lost, so don't wait for timeout

TCP fast retransmit
