Maximum Flow and Minimum Cut

Max flow and min cut.

- Two very rich algorithmic problems.
- Cornerstone problems in combinatorial optimization.
- Beautiful mathematical duality.

Nontrivial applications / reductions.

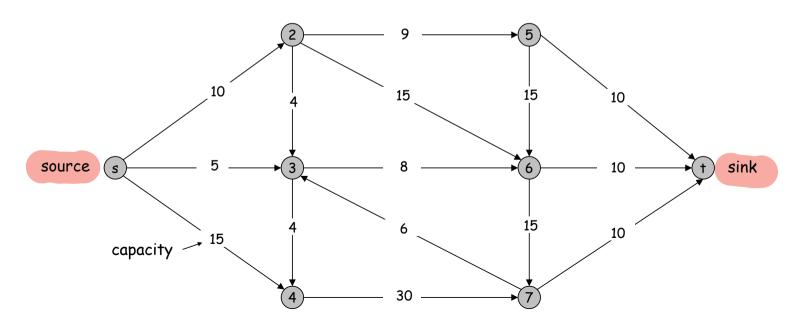

- Data mining.
- Open-pit mining.
- Project selection.
- Airline scheduling.
- Bipartite matching.
- Baseball elimination.
- Image segmentation.
- Network connectivity.

- Network reliability.
- Distributed computing.
- Egalitarian stable matching.
- Security of statistical data.
- Network intrusion detection.
- Multi-camera scene reconstruction.
- Many many more ...

Minimum Cut Problem

Flow network.

- Abstraction for material flowing through the edges.
- G = (V, E) = directed graph, no parallel edges.
- Two distinguished nodes: s = source, t = sink.
- c(e) = capacity of edge e.

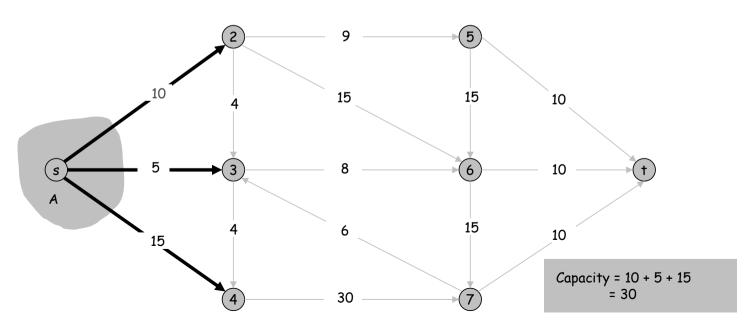

Cuts

Def. An s-t cut is a partition (A, B) of V with $s \in A$ and $t \in B$.

Def. The capacity of a cut (A, B) is: cap(A, B)

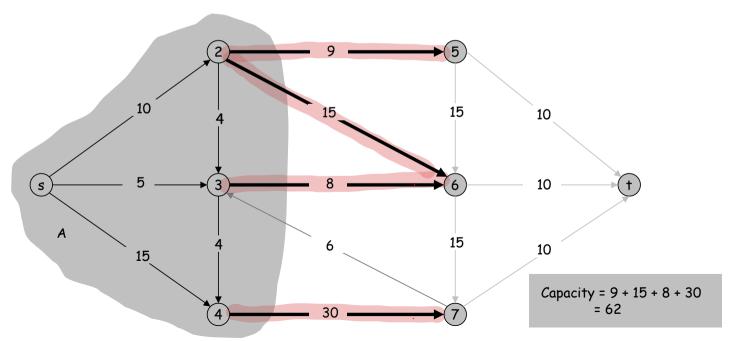

$$cap(A, B) = \sum_{e \text{ out of } A} c(e)$$

Cuts

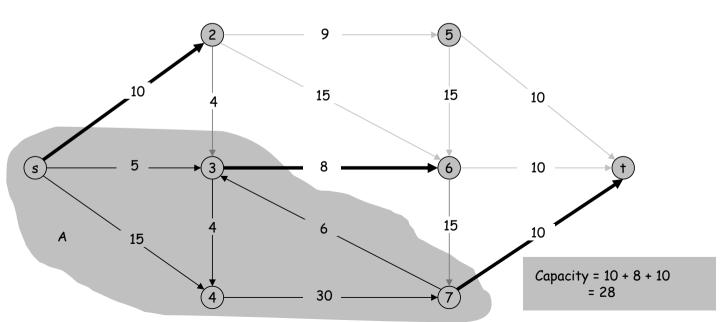

Def. An s-t cut is a partition (A, B) of V with $s \in A$ and $t \in B$.

Def. The capacity of a cut (A, B) is: $cap(A, B) = \sum_{e \text{ out of } A} c(e)$

Minimum Cut Problem

Min s-t cut problem. Find an s-t cut of minimum capacity.

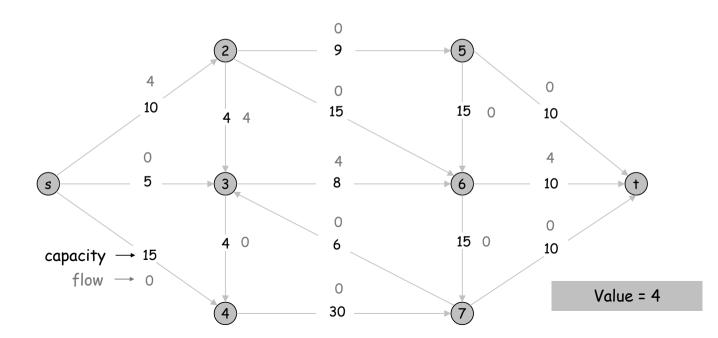

Flows

Def. An s-t flow is a function that satisfies:

- For each $e \in E$: $0 \le f(e) \le c(e)$
- [capacity]
- For each $v \in V \{s, t\}$: $\sum f(e) = \sum f(e)$ [conservation]
 - e out of v

Def. The value of a flow f is: $v(f) = \sum f(e)$. e out of s

Flows

Def. An s-t flow is a function that satisfies:

- For each $e \in E$: $0 \le f(e) \le c(e)$

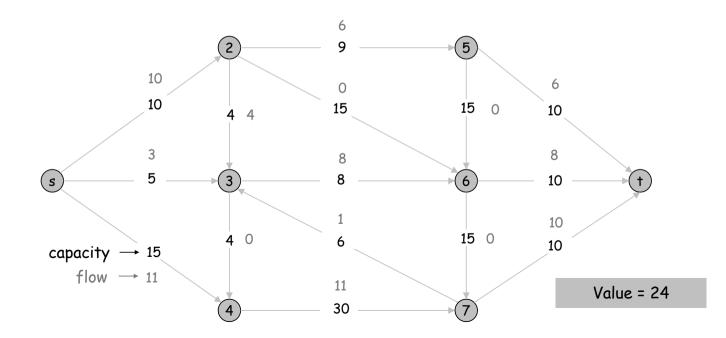

- [capacity]
- For each $v \in V \{s, t\}$: $\sum f(e) = \sum f(e)$

$$\sum_{e \text{ out of } v} f(e) = \sum_{e \text{ out of } v} f(e)$$

[conservation]

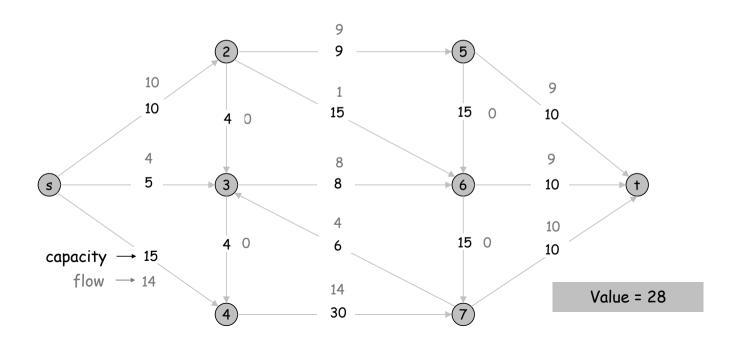

Def. The value of a flow f is: v(f) =

$$v(f) = \sum_{e \text{ out of } s} f(e)$$
.

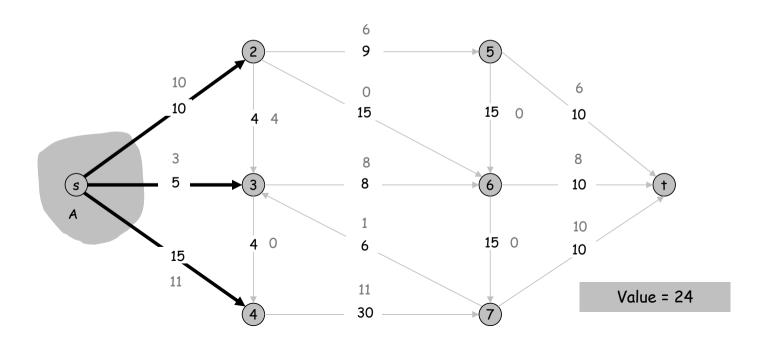

Maximum Flow Problem

Max flow problem. Find s-t flow of maximum value.

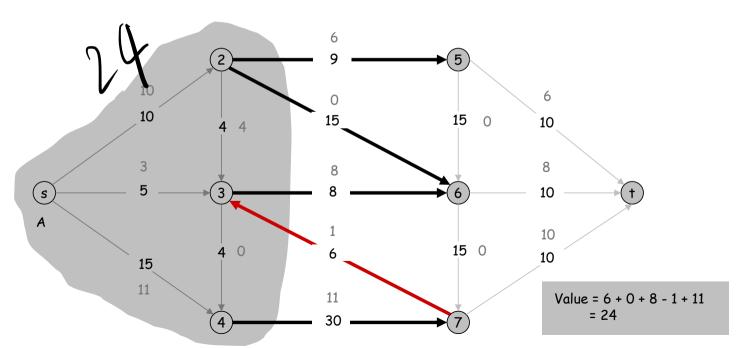

Flow value lemma. Let f be any flow, and let (A, B) be any s-t cut. Then, the net flow sent across the cut is equal to the amount leaving s.

$$\sum_{e \text{ out of } A} f(e) - \sum_{e \text{ in to A}} f(e) = v(f)$$

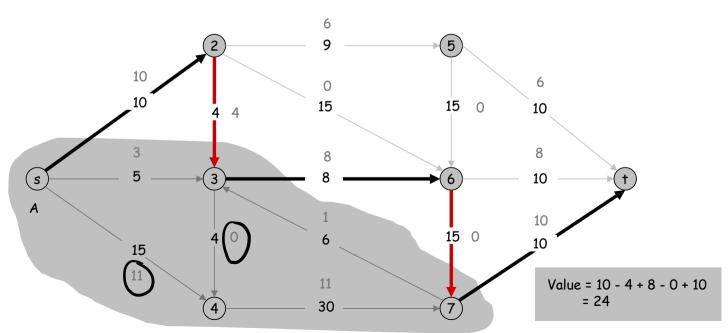

Flow value lemma. Let f be any flow, and let (A, B) be any s-t cut. Then, the net flow sent across the cut is equal to the amount leaving s.

$$\sum_{e \text{ out of } A} f(e) - \sum_{e \text{ in to A}} f(e) = v(f)$$

Flow value lemma. Let f be any flow, and let (A, B) be any s-t cut. Then, the net flow sent across the cut is equal to the amount leaving s.

$$\sum_{e \text{ out of } A} f(e) - \sum_{e \text{ in to A}} f(e) = v(f)$$

Flow value lemma. Let f be any flow, and let (A, B) be any s-t cut. Then, the net flow sent across the cut is equal to the amount leaving s.

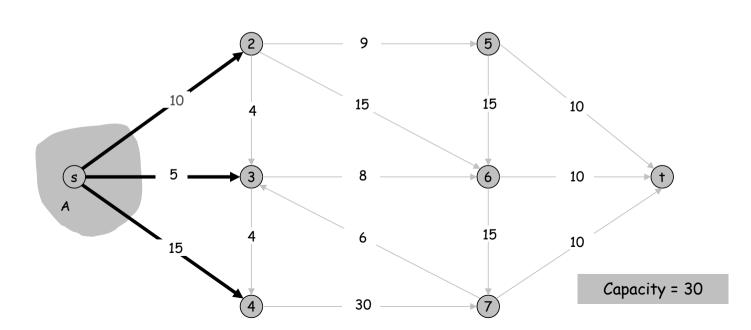

$$\sum_{e \text{ out of } A} f(e) - \sum_{e \text{ in to } A} f(e) = v(f).$$

Pf.
$$v(f) = \sum_{e \text{ out of } s} f(e)$$
by flow conservation, all terms
$$\rightarrow = \sum_{v \in A} \sum_{e \text{ out of } v} f(e) - \sum_{e \text{ in to } v} f(e)$$

$$= \sum_{e \text{ out of } f(e)} f(e) - \sum_{e \text{ in to } v} f(e).$$

Weak duality. Let f be any flow, and let (A, B) be any s-t cut. Then the value of the flow is at most the capacity of the cut.

Cut capacity = 30 \Rightarrow Flow value \leq 30

Weak duality. Let f be any flow. Then, for any s-t cut (A, B) we have $v(f) \le cap(A, B)$.

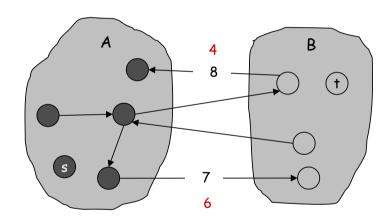

Pf.

$$v(f) = \sum_{e \text{ out of } A} f(e) - \sum_{e \text{ in to } A} f(e)$$

$$\leq \sum_{e \text{ out of } A} f(e)$$

$$\leq \sum_{e \text{ out of } A} c(e)$$

$$= cap(A, B) \quad \blacksquare$$

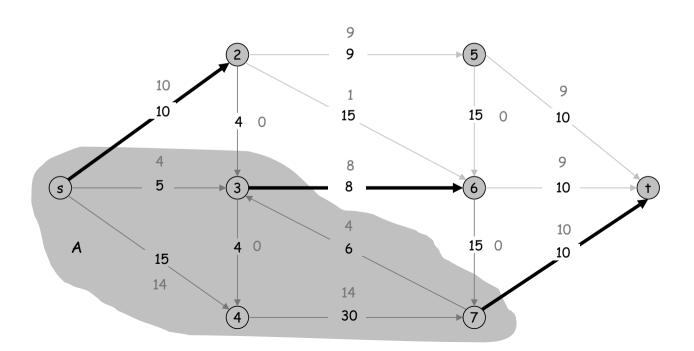

Certificate of Optimality

Corollary. Let f be any flow, and let (A, B) be any cut. If v(f) = cap(A, B), then f is a max flow and (A, B) is a min cut.

Value of flow = 28

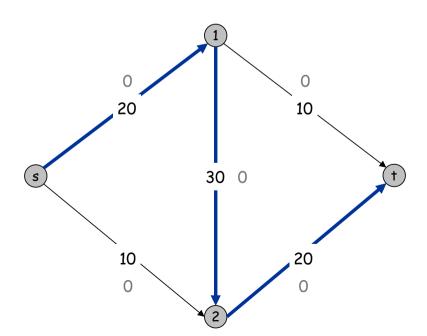

Cut capacity = 28 \Rightarrow Flow value \leq 28

Towards a Max Flow Algorithm

Greedy algorithm.

- Start with f(e) = 0 for all edge $e \in E$.
- Find an s-t path P where each edge has f(e) < c(e).
- Augment flow along path P.
- Repeat until you get stuck.

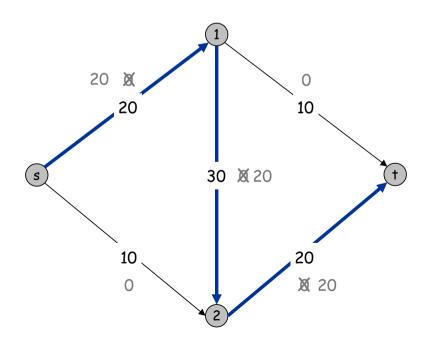

Flow value = 0

Towards a Max Flow Algorithm

Greedy algorithm.

- Start with f(e) = 0 for all edge $e \in E$.
- Find an s-t path P where each edge has f(e) < c(e).
- Augment flow along path P.
- Repeat until you get stuck.

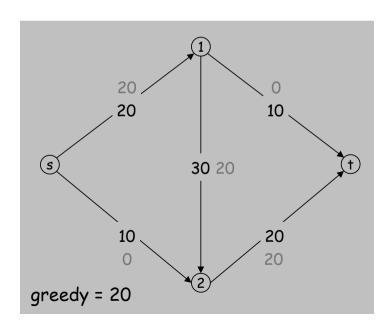

Flow value = 20

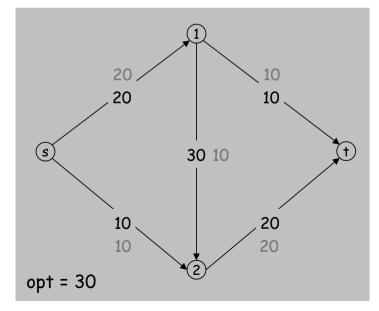

Towards a Max Flow Algorithm

Greedy algorithm.

- Start with f(e) = 0 for all edge $e \in E$.
- Find an s-t path P where each edge has f(e) < c(e).
- Augment flow along path P.
- Repeat until you get stuck.

locally optimality ⇒ global optimality

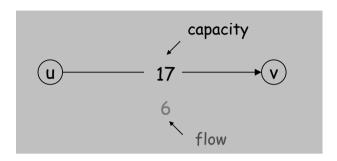

Residual Graph

Original edge: $e = (u, v) \in E$.

Flow f(e), capacity c(e).

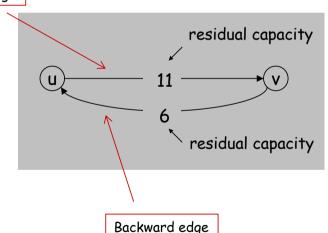

Residual edge.

- "Undo" flow sent.
- e = (u, v) and $e^{R} = (v, u)$.
- Residual capacity:

$$c_f(e) = \begin{cases} c(e) - f(e) & \text{if } e \in E \\ f(e) & \text{if } e^R \in E \end{cases}$$

Forward edge

Residual graph: $G_f = (V, E_f)$.

- Residual edges with positive residual capacity.
- $E_f = \{e : f(e) < c(e)\} \cup \{e^R : f(e) > 0\}.$

Augmenting path

Def. An augmenting path is a simple s->t path in the residual graph G_f

Def. The bottleneck capacity of an augmenting path P is the minimum residual capacity of any edge in P.

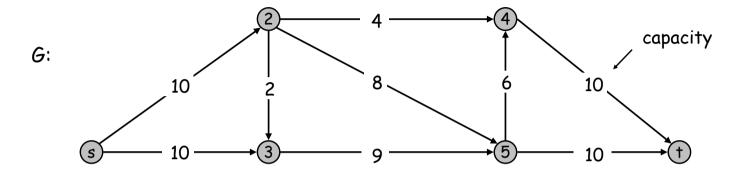

Key property. Let f be a flow and let P be an augmenting path in G_f , then after calling $f' \leftarrow Augment(f,c,P)$, the resulting f' is flow and

$$v(f) = v(f) + bottleneck(G_f,P)$$

Augmenting Path Algorithm

```
Ford-Fulkerson(G, s, t, c) {
   foreach e ∈ E f(e) ← 0
   G<sub>f</sub> ← residual graph

while (there exists augmenting path P) {
   f ← Augment(f, c, P)
     update G<sub>f</sub>
   }
   return f
}
```

Max-Flow Min-Cut Theorem

Augmenting path theorem. Flow f is a max flow iff there are no augmenting paths.

Max-flow min-cut theorem. [Elias-Feinstein-Shannon 1956, Ford-Fulkerson 1956] The value of the max flow is equal to the value of the min cut.

- Pf. We prove both simultaneously by showing TFAE (the following are equivalent):
 - (i) There exists a cut (A, B) such that v(f) = cap(A, B).
 - (ii) Flow f is a max flow.
 - (iii) There is no augmenting path relative to f.
- (i) \Rightarrow (ii) This was the corollary to weak duality lemma. (Slide 17)
- (ii) \Rightarrow (iii) We show contrapositive.
 - Let f be a max flow. If there exists an augmenting path, then we can improve f by sending flow along path.

Proof of Max-Flow Min-Cut Theorem

(iii)
$$\Rightarrow$$
 (i)

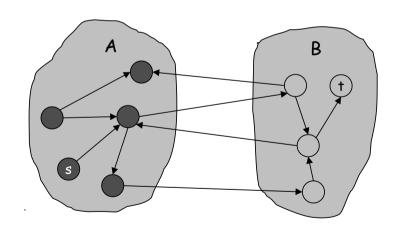

- Let f be a flow with no augmenting paths.
- Let A be set of vertices reachable from s in residual graph.
- By definition of $A, s \in A$.
- By definition of f, $t \notin A$.

f(e) = 0, if not, there will be a backward edge in G_f , Violate no augmenting paths in G_f

$$v(f) = \sum_{\substack{e \text{ out of } A \\ e \text{ out of } A}} f(e) - \sum_{\substack{e \text{ in to } A \\ e \text{ out of } A}} f(e)$$

$$= \sum_{\substack{e \text{ out of } A \\ e \text{ out of } A}} f(e)$$

If not, there will be a forward edge in G_f , Violate no augmenting paths in G_f

original network

Running Time

Assumption. All capacities are integers between 1 and $C = \sum_{e \text{ out of } s} c(e)$

Invariant. Every flow value f(e) and every residual capacity $c_f(e)$ remains an integer throughout the algorithm.

Theorem. The algorithm terminates in at most $v(f^*) \le C$ iterations. Pf. Each augmentation increase value by at least 1.

To find an s-t path in G_f , say by BFS, O(m+n) with $m \ge n/2$, Procedure augment(f,P) takes O(n), as the path has at most n-1 edges

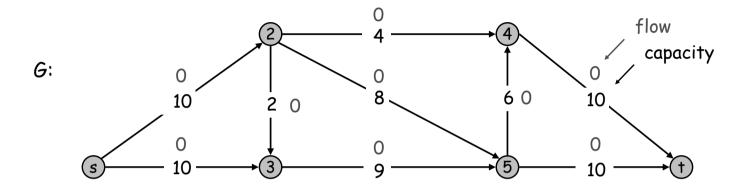

Corollary. If C = 1, Ford-Fulkerson runs in O(mn) time.

0 (M+N). M

Integrality theorem. If all capacities are integers, then there exists a max flow f for which every flow value f(e) is an integer.

Pf. Since algorithm terminates, theorem follows from invariant.

7. Ford-Fulkerson Demo

Flow value = 0
